

Fernando Agustin Teodoro

Melbourne, VIC · 0435 235 550 · fernandoagustin803@gmail.com · linkedin.com/in/fernando-agustin-teodoro · github.com/fteodoro803

Summary

Full-stack developer who finds overlooked gaps in existing systems – a hospital's wait times, a country's missing carpool infrastructure, a commuter's repeated app searches – and builds and deploys the practical fix, from product strategy through to production. Comfortable across React, React Native, Flutter, Python, and Postgres/Mongo backends, and increasingly deciding what to build, not just how to build it.

Experience

Full-Stack Developer – Pa-Ride (Philippines Carpool Marketplace) · Aug 2026 – Present

React Native · TypeScript · Supabase (Postgres, PostGIS, Realtime)

- Took a one-line pitch and independently researched the market before designing the product strategy and building the full data model (26-migration Postgres schema) solo
- Positioned the product as cost-sharing rather than ride-hailing to stay outside Philippine ride-hailing regulation – reflected in pricing, copy, and a non-binding price suggestion
- Designed a PostGIS-based corridor-matching algorithm that matches riders to drivers passing near their route, not only drivers going to their exact destination
- Built seat booking and negotiation as concurrency-safe Postgres functions with row-level locking, so availability can't be oversold or bypassed by a compromised client

Full-Stack Developer – Realtime Queue Management System · Feb 2026 – Present

React · TypeScript · Meteor · MongoDB · Docker · Google Cloud

- Originated from a personal story about hospital wait times in the Philippines; grew into a multi-tenant RBAC platform any organisation running a queue can use
- Architected the platform from the ground up – companies, facilities, role-scoped staff, a permission engine, and audit logging – spanning 74 Meteor methods and 35 real-time publications
- Found and fixed a wait-time calculation that had drifted into three inconsistent implementations, closing a cross-facility data leak in the same pass
- Designed a mobile-first, low-bandwidth UI with optimistic updates and live-validated phone inputs, shaped by the real device, network, and literacy constraints of the target market
- Grew the test suite to 180+ unit and integration tests, running in CI on every pull request

Full-Stack Developer – Melbourne Public Transport Widget · Mar 2025 – Dec 2025

Flutter · Python (Flask) · WidgetKit/SwiftUI · GTFS Realtime · Built with a collaborator

- Built a personalised departure-board app (Flutter, cross-platform) and an iOS home-screen widget, co-built end-to-end with a collaborator
- Built the Flask/MongoDB backend that scrapes and versions PTV's transit feed, only reprocessing when the source data actually changes
- Implemented PTV's HMAC-SHA1 request-signing scheme from scratch and merged GTFS Realtime feeds with scheduled data into one model

Product Owner & Full-Stack Developer – C-LARA Image Annotation Tool · Aug-Nov 2023

Python · Django · React

- Acted as Product Owner for a 5-person university capstone team, translating an evolving external spec into sprint-level requirements
- Owned the Django REST API solo (11 endpoints, 37-test suite); co-built the React frontend, including a stroke-stitching algorithm for freehand annotation
- Graded H1 (top grade band), with strong feedback from the platform's technical lead

Freelance QA Tester – UK ETA Visa Services (iOS) · May 2026

Manual QA · Freelance via Upwork

- Manually tested a visa-application app end-to-end for a paid client engagement, working through the full flow beyond the brief's expected scope
- Earned a 5-star client review

Ad-hoc Programmer – NutTAG Australia · Dec 2023 – Jan 2024

- Redesigned an AI customer-support chatbot's conversation flow to address NutTAG's own documented customer-support complaints
- Got up to speed on a system recently inherited from another company before continuing work on it

Skills

Languages/Frameworks: Java, JavaScript, TypeScript, Python, React, React Native, SQL, Tailwind, Dart, C#, Unity
Practices: Git, Agile, Pair Programming, Root-Cause Analysis, AI-Assisted Development (Claude Code, GitHub Copilot)
Real-time/streaming: WebSocket-based sync (Meteor DDP, Supabase Realtime), GTFS Realtime, optimistic UI patterns

Education

BSc Computing & Software Systems – University of Melbourne, 2023
